Dashboard

The Dashboard page is the central hub of the application.

- High-level metrics showing total logs collected, active devices, and pending critical alerts.
 - File Activity (Navigate to the File Operations) - Display total file operations within last 24 hours
 - System Events (Navigate to the System Actions) - Display previous events within 24hrs
 - User Sign-Ins (Navigate to the User Sign-in) - Display total unique users within last 24hrs
 - Unread Alerts (Navigate to the Alerts page) - Display the count of the all unread alerts
- Activity Trends (7-Day Activity Pulse) : Visual charts representing log volume over customized time thresholds, allowing you to spot anomalies quickly
- Device Status : A grid view of all collectors, including their current connectivity and active/inactive status
- Recent Unread Alerts : Display the list of unread critical security alerts here
- Security Overview
 - Active Secure Folders – (Redirects to “secure-folder”) Number of active secure folders being monitored
 - Folder Access Events - Shows how many times monitored folders were accessed
 - Honeypot Traps Set – Displays number of honeypot traps currently configured
 - Traps Breaches - Displays how many honeypots were triggered
- Data Insights (7-Day)
 - Displays file activity insights collected from the system
 - Shows which file types are most frequently operated on

Universal Search

The Universal Search Page allows users to :

- Search the entire system from one place
- Find users, files, alerts, and logs
- View categorized results
- Quickly navigate to specific records
- Perform fast system-wide searches

Alerts

The Security Alerts page allows administrators to monitor, review, and manage system security alerts generated from file activities, user behavior, and suspicious operations.

The Security Alerts Page allows administrators to :

- Monitor security incidents
- View alert statistics
- Filter alerts by category, reason, or status
- Investigate detailed alert information
- Mark alerts as resolved
- Track suspicious system activities

It helps detect and investigate potential security incidents.

- Real-time Notifications: Get instantly alerted to suspicious activities like unauthorized access or mass deletions
- Severity Levels: Alerts are categorized (e.g., Info, Warning, Critical) so you can prioritize your response
- Incident Tracking: Mark alerts as Read or Unread to maintain an accurate workflow of handled security incidents

Log Analytics

User Activity

This dashboard provides analytics and monitoring of user activity in the Filestation system.

It helps administrators to :

- Track user login behavior
- Analyze file operations
- Monitor file transfers
- Identify file type usage trends

Recent Login Attempts - This card displays user login activity statistics.

Information Displayed :

- Total login attempts
- Login activity trends
- User login behavior patterns

Purpose - Helps administrators detect :

- Suspicious login attempts
- Unusual login patterns
- Possible brute-force attacks

Filestation Behaviour - This section displays file operations performed by users.

*Ex: File uploads, File downloads, File deletions, File modifications,
File access*

Interactive Feature - Users can click on an action type to view detailed activity.

Ex: Clicking Download shows all download events

Total File Transfer - Displays statistics related to file transfers.

Information Included :

- Total files transferred
- Upload counts
- Download counts
- Transfer activity distribution

System Logs

It helps administrators to:

- Monitor system-level events and operations
- Track recent system actions
- Filter actions by type, device, port, severity, and date
- Quickly identify critical events or unusual system behavior

System Metrics Summary

Total System Actions : Number of system actions overall (system_admin events)

Recent Actions : Number of actions in the last 24 hours

Operation Logs Table

Description : Short summary of the system action. Truncated if too long, full text on hover

Device : Device name or identifier where the action occurred

Timestamp : Action timestamp formatted using formatSLTime() for local readability

File Operations

This page allows administrators to monitor and analyze file operations on Synology NAS devices. It provides metrics, patterns of file access, and filtering/pagination capabilities to optimize storage management, detect unusual activity, and improve security.

File Operation Metrics

Purpose - Display summary metrics for file operations in the selected duration.

Metrics Examples -

- Total files accessed
- Files created, modified, or deleted
- Active users or devices

Duration Selector - Dropdown to select time range (24h, 7d, 30d)

File Access Patterns

Purpose - Display detailed logs of file operations filtered by user, device, file type, and action.

- Can filter by username, device, file extension, action

Raw Logs / Parsed Logs

This page provides a centralized view of all log entries collected from syslog sources, enabling administrators to monitor system events, troubleshoot issues, and inspect raw log messages in detail.

Raw Syslog Streams - Display paginated and sortable table of all logs

User Sign-in

The User Sign-in page allows administrators to monitor authentication activity across the system. It provides visibility into who logged in, from which device, from which IP address, and at what time.

This helps with :

- Security auditing
- Detecting suspicious login behavior
- Monitoring user access activity
- Investigating authentication issues

Shared Folder Access

The Shared Folder Access page allows administrators to monitor and audit access to shared folders across devices and users. It provides a centralized view of all recorded access events, enabling administrators to track activity, identify usage patterns, and investigate potential security issues. This page displays summary statistics, filterable logs, and detailed access information.

- **Total accesses** : The total number of times any shared folder has been accessed
- **Unique folders** : The number of different shared folders that have been accessed
- **Unique users** : The total number of distinct users who have accessed any shared folder
- **Last 24 Hours** : How many folder accesses happened in the past 24 hours

Reports

User Activity Report

This page provides a detailed analysis of file operation activities performed by individual users.

It helps administrators and analysts to :

- Monitor user behavior
- Detect unusual activity patterns
- Review audit logs
- Perform forensic investigations
- Identify peak usage periods

The report visualizes activity through :

- Operation Matrix
- Activity Trend Chart

Activity Calender

The NAS User Sign-in Calendar page provides a visual monthly overview of a user's file activity on the NAS system.

It allows administrators to :

- Track which days a user performed file operations
- Identify active vs inactive days
- View detailed activity logs for any specific day
- Export daily activity reports as CSV files
- Perform audit or forensic investigations

The interface uses a calendar view, making it easy to quickly understand user behavior over a month.

Secure Folders

The Secure Folder Management page allows administrators to monitor, manage, and track sensitive directories on the system.

It helps administrators to :

- Add folders to monitor
- Edit folder details
- Delete folders when no longer needed
- View access logs for each folder
- Perform deep history scans to trace past access

This ensures sensitive files are properly secured, and access is transparent and auditable.

Honeypot

The Honeypot Management page allows security administrators to deploy, monitor, and manage decoy files (honeypots) to detect unauthorized access. It provides insights into file interactions, user activity, and system security threats.

Total Trap Files - The total number of honeypot trap files you have deployed

Active Traps - The number of honeypot traps that are currently active and monitoring

Inactive Traps - The number of traps that are disabled or not currently monitoring

This helps with :

- Security auditing
- Detecting suspicious login behavior
- Monitoring user access activity
- Investigating authentication issues

Device Management

The Device Management page allows administrators to monitor, license, and manage devices across the organization. This page provides visibility into device activity, assignment status, and license usage, enabling effective fleet optimization and compliance.

Total Devices - Total devices in the system

Active Devices - Devices currently reporting data

Recently Added Devices - Devices recently added

Inactive Devices - Devices not reporting

Awake Devices - Devices currently online

Key capabilities include :

- Viewing the status of assigned and unassigned devices
- Managing device work periods and operational status
- Assigning and de-authorizing license keys
- Navigating device logs for detailed audit and troubleshooting

The interface is divided into three tabs :

- Assigned Fleet – Devices currently assigned to the company
- Awaiting Assignment – Devices detected but not yet assigned
- License Management – Overview of license keys and their assigned devices

Administration

Users

The Admin Users Page provides a comprehensive interface for managing administrative users within your system.

It allows Super Admins and Admins to :

- View a paginated list of all users
- Add, edit, or delete users
- Manage user roles and give permissions
- Search and filter users efficiently

The page is designed for efficiency, clarity, and secure user administration.

Activity Calender

The Admin Logs Page provides a centralized interface for monitoring all system and file operation logs.

It enables administrators to :

- View real-time system activity and user operations
- Track file-related actions including uploads, downloads, and modifications
- Paginate through logs efficiently for large datasets
- Filter logs by type (System Logs or File Operations)
- Analyze user, device, and action details for auditing and troubleshooting

System Logs - Displays events like user actions, system changes, and security alerts

File Operations - Tracks actions on files, including creation, deletion, modification, and transfers

Profile

The Profile & Company Info Page allows authenticated users to :

- View their personal profile information
- Access detailed company information
- Monitor registered devices and their work hours
- Review device keys and package validity
- Track countdowns for key expiration

This page ensures administrators have full visibility into their organization and devices.

Profile / Company Info - View your company's registration dates, Activation Key, running Port

Registered Devices - The list of all assigned devices

Device Keys - View your active licensing packages, their start dates, and precisely how many days remain until expiration

Help

The Help Page serves as a centralized guide for administrators and users of the Syslog Client, providing step-by-step documentation, feature explanations, and compliance information.

It's structured for easy scanning and interactive learning.
